Sigillo call cheat sheet | **Do not know?** “Good question. I’ll check with the team and come back to you today.” Write it down, send to Giovanni. | **Never** guess, invent numbers/dates, or say “tamper-proof”, “compliant”, “AI Act ready”, “certified”. | End every call with **one next step + a date**.

I only have two minutes. What exactly is Sigillo?	A black box for AI agents: every action gets a signed receipt, and anyone can check later that nothing was changed. We keep fingerprints, never your content.
Why would a company like ours need this?	When an agent touches contracts, money, hiring or personal data, someone will ask what really happened. You get a record you can show a customer, auditor or lawyer.
Does Sigillo stop the agent from making mistakes?	No. It is a black box, not a seatbelt. It does not prevent mistakes; it proves what happened and that the record was not touched afterwards.
We already have logs. What is different?	Logs are written by the same system and can be edited. Receipts are signed with a key the agent does not hold, chained, and checkable by an outside program.
Can't we just build this ourselves?	You can log, yes. The difference is who can change the record. A sealed record checked by an outside program is different, and hard to build well.
A competitor offers qualified eIDAS timestamps. Why not them?	Some have stronger legal marks; I will not pretend otherwise. We connect to your agent as it is, built for Europe. If qualified timestamps are a must, tell me.
Do you see our data and prompts?	No. We store only fingerprints, never the text. By default the fingerprint is made on your side. (Optional gateway: text passes through memory, not saved.)
Do you use our data to train anything?	No. We do not store the content, so there is nothing to train on.
Where is the data stored, and who can access the servers?	A server in Europe, access limited to our technical team, encrypted daily backup. Honest limit: an administrator could read what is stored: fingerprints and account details.
Receipts cannot be deleted. How do we respect the right to erasure?	Receipts hold a pseudonym, not names. To erase a person we delete the link to the pseudonym; the chain stays valid. Tip: no personal data in free-text names.
What happens with our model API keys if we give them to you?	Stored encrypted, only the last 4 digits visible. But to call the model we must open it in memory, so I will not say nobody could see it. Safest: do not give us a key.
Can you, or a hacker, fake or change a receipt?	Signed with a key in a separate process the agent never holds; any change is detected by the checker, and the chain goes to a public timestamp service.
Have you been penetration-tested or audited? SOC 2? ISO 27001?	No. Own design, tests and reviews; no certification, no external audit yet, an independent review is planned. I prefer to tell you now.
What happens if you are hacked?	We have an incident plan: we tell our partner within 48 hours, so you meet the 72-hour GDPR deadline. We hold fingerprints, so no readable content to leak.
What happens if Sigillo is down? Does our agent stop?	The pilot has no guaranteed uptime, so some events could be missed. I will send you the exact behaviour in writing today.
Is a Sigillo receipt valid in court?	Strong technical evidence that a record was not changed. I will not say what a court accepts; the timestamp is public, not qualified. Your lawyer decides.
Does Sigillo make us AI Act compliant?	No tool alone makes you compliant. Sigillo helps keep a record that cannot be quietly altered. Whether you are in scope is for your lawyer.
GDPR: who is the controller? Do we need a DPA?	You decide what is recorded, so you are the controller. We have draft data-handling and DPA documents; a lawyer must review them. I will ask Giovanni to send them.

Your login uses Google. Does our email address leave the EU?	Sign-in uses Firebase (Google), which may process the email outside the EU under standard safeguards. Still being confirmed with a lawyer; I will send the exact position.
Who are you? Which company do we sign with?	I will answer this in writing today. (Do not improvise; send the question to Giovanni.)
How do you connect to our agent? Do we have to change our code?	A developer installs our small package and adds a few lines (or we do it with you). The rest of the agent stays as is. Python today; under an hour.
What exactly do you record?	Each action: kind, time, and fingerprints of inputs and outputs. Not the content itself.
Do you support LangChain, CrewAI, OpenAI, Anthropic?	Python agents, common frameworks and OpenAI-style models. For a specific one I will confirm today; I will not say yes just to be nice.
What is the performance impact on our agent?	I have no measured numbers and will not guess. I will ask the engineer today; the pilot measures it on your real agent.
Is it open source? Can we read the code?	The checker is a small, readable program anyone can run offline. Licensing is still being decided, so I do not call it open source yet.
How do we verify a receipt ourselves, without you?	With the checker program on your own computer, offline, without our servers. There is also a public page to check an export in the browser.
Can you handle our volume? How many receipts?	Standard covers up to 100,000 receipts a month. Far above that, we talk about a custom plan.
Is there an API? Can we export the data?	Yes, a documented API, and receipts export as a pack you can check offline. I will send the docs to your developer.
How much does it cost, really? Any extras?	Pilot free. Standard is indicatively about 190 euro/month incl. 100,000 receipts. Indicative; we confirm after the pilot. Never quote discounts or commissions.
What is in the free pilot? What is the catch?	One agent, up to 10,000 receipts a month. In return: feedback, a short case study if you are happy, and a contact. No uptime guarantee yet.
You have no customers yet. Why should we trust you?	Fair. We are early, so the pilot is free and I tell you exactly what is not done (no audit, no certification). Early customers shape the product.
How does your encryption and key handling work internally, exactly? Algorithms, key rotation?	Good technical question; I will not guess. Best answered by our engineer: may I set a 20-minute technical call with you and your developer?
When will you have SOC 2, self-hosting, and Java support?	I have no dates and will not invent them. Today: online service, Python agents. I will note your interest and come back to you.
Sounds interesting. Just send me some information and I will have a look.	Happy to. Which agent would you try first, and who else should see it? I send a 3-minute video and one page. May I check in on Thursday?
We are busy right now. Maybe next quarter.	Understood. Is it timing or the idea itself? The pilot is small, under an hour to connect. May I check back in a few weeks?
I like it, but I need to talk to my boss.	Of course. I will send a 3-minute video and a one-page summary to forward. What will your boss care about most? May I check in on [day]?
